- 5 Regulated by the Ministry of Health and the Ministry of Tourism**

# TOP RANKED MEDICAL DESTINATION IN TURKEY

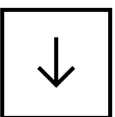

IdealOfMeD stands proudly as one of the highest-rated medical destinations in Turkey, as recognized by Google and Trustpilot, among many other independent rating institutions and sources.

“ **WDW B BV B B B**  
**D B B BV B B B B**  
**BD B D D BV** ”

*Joshua Meyer, from Switzerland*

With a stellar reputation for quality care and exceptional results, IdealOfMeD has become a beacon of excellence in the industry. Whether you're seeking a life-changing hair transplant or top-tier dental treatments, our expert team is dedicated to delivering the highest standards of care.

At IdealOfMeD, we understand that choosing a medical partner is a significant decision. Rest assured, our outstanding ratings reflect our dedication to providing world-class care in a welcoming and professional environment.

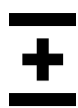

THE BEST HAIR TRANSPLANT DESTINATION

# BEFORE & AFTER

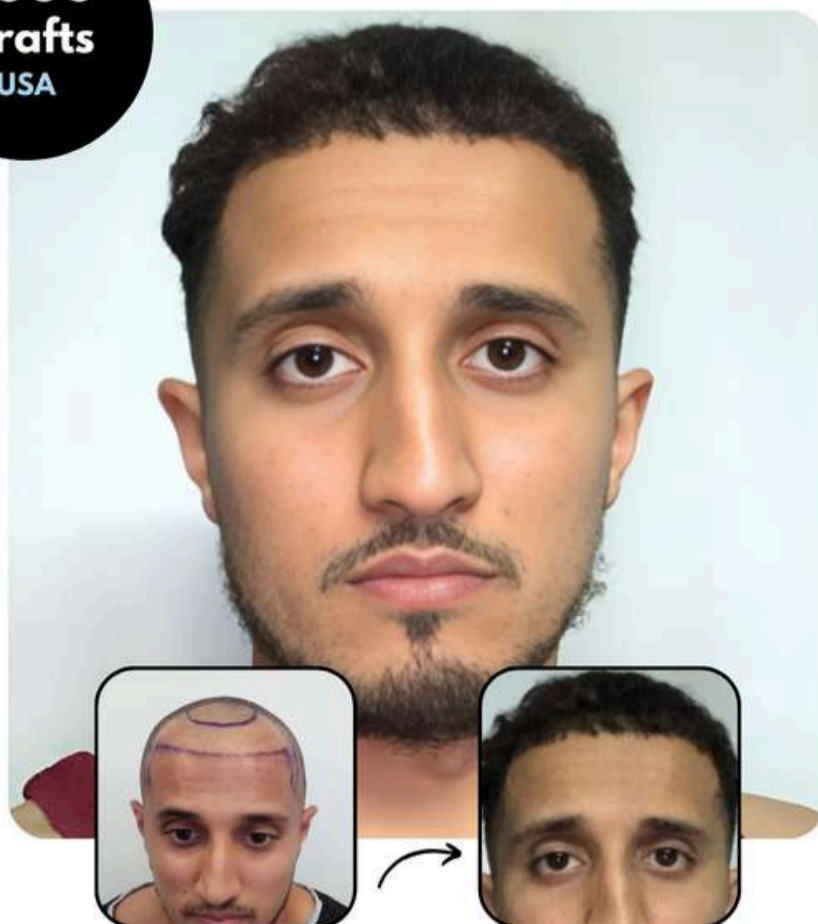

# IDEAL ICE FUE SAPPHIRE METHOD

For completely bald patients or where baldness is very severe in a particular area, the Ideal ICE FUE Sapphire Method can be the ideal procedure for such patients.

3000 Grafts USA

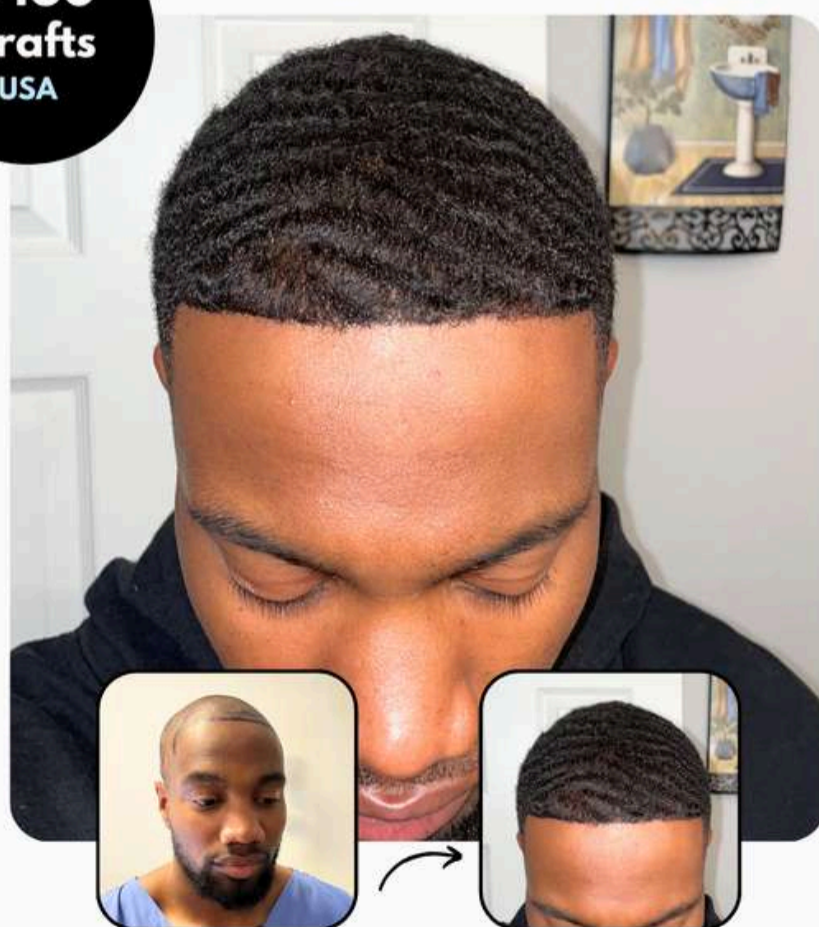

5100 Grafts UK

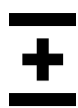

Extraction is done graft by graft, either manually or with automated tools; micro-incisions to place the follicle units are created using an Ideal Sapphire Blade, which leaves virtually no scarring that can be seen with the naked eye. Then the grafts are carefully inserted into the related micro-incisions. The Ideal ICE FUE Sapphire Method should not be confused with the standard FUE Method, where

titanium/steel scalpels are used instead of Sapphire blades and where merely transplantation fluid is utilized for storing the follicles. The primitive standard FUE method is more invasive, using less sharp tools, which can cause severe discomfort, longer healing times, lower graft survival rates, damage to existing hair, and scarring. Due to the high standards of IdealofMeD.'s clientele, this inferior method is not offered.

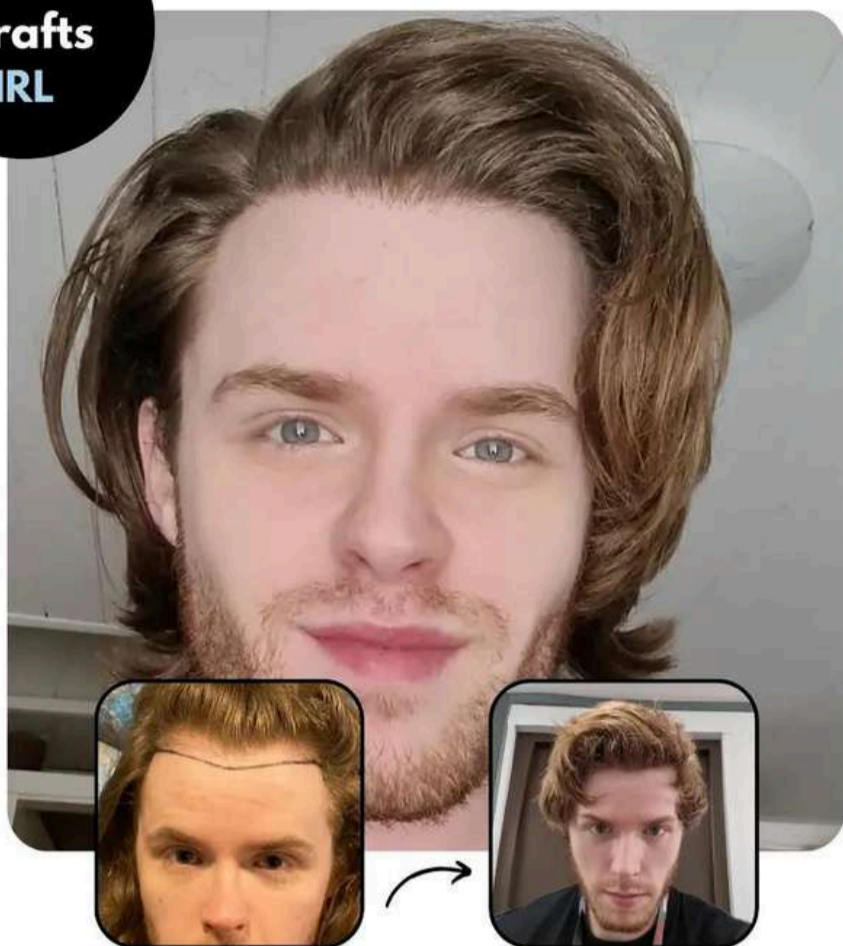

2450 Grafts USA

2600  
Grafts  
IRL

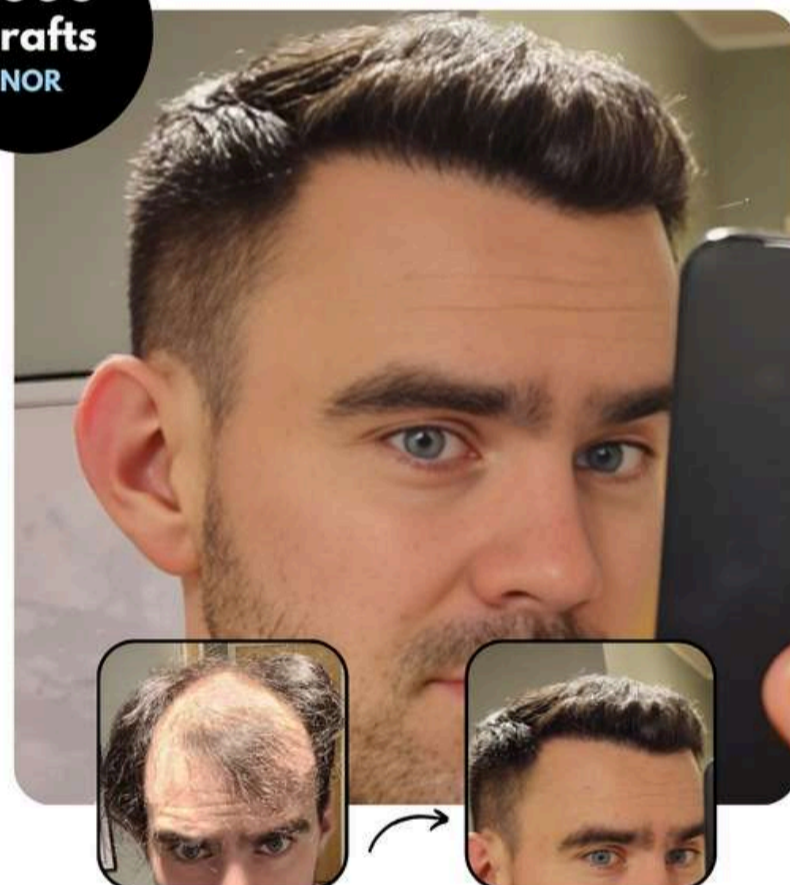

Results 9 months after getting an Ideal ICE FUE Sapphire procedure.

We welcome patients from di- Every single incision done by the medical team is counted and noted for our internal files. The extraction phase is also important as it will determine the quality of the donor area going forward. The scalpel used to open the channels is made of sapphire and is sharper than those made of steel or titanium, which are used in inferior methods. In particular, these are some of the characteristics of the blades:

- a) **Extraction phase:** Hollow sapphire needles, with diameters tailored to the patient, are used. Extraction can be done manually or with tools, depending on the situation.
- b) **Micro-channel opening phase:** Sapphire needles of various sizes are chosen based on the patient's hair structure to open micro-incisions. Incisions are oriented to match the natural direction of hair growth.

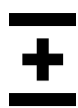

The micro-incision part of an FUE Sapphire surgery is one of the most important stages of this type of hair restoration, and it demands significant skill, expertise, and experience. The angle at which the micro-incisions are done and the density planned could determine the success of the entire hair restoration. The micro-incisions can take up to 2 hours to plan and execute.

5000  
Grafts  
NOR

Results 12 months after getting an Ideal ICE FUE Sapphire procedure.

The use of this innovation allows us to achieve an even higher level of quality compared to traditional hair transplant techniques.

## ADVANTAGES OF HAIR TRANSPLANTS WITH AN IDEAL SAPPHIRE BLADE

**1. Reduced bleeding:** The sharp blades allow obtaining a V-shaped opening of the micro-channels, instead of the classic U-opening. This way of opening micro-channels allows them to be smaller, and therefore causes less bleeding.

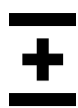

**2. Greater graft density:** Smaller V-channels allow you to concentrate multiple grafts on the same surface. With the traditional FUE technique, it is possible to implant 40-60 units, while with the method of grafting hair with a sapphire scalpel, the possibilities increase up to 80-120 units per square centimeter if required.

**3. Greater control of the follicular unit's direction** thanks to the greater precision of the sapphire scalpel. The result is a more natural look.

**4. Shorter healing period:** The recovery time after the hair transplant is reduced; the risk of skin problems is minimized, and the scalp surface remains smooth. With this method, the recovery period after a hair transplant is short and with fewer complications. It is important to always follow the steps for post-op care recommended by our experts.

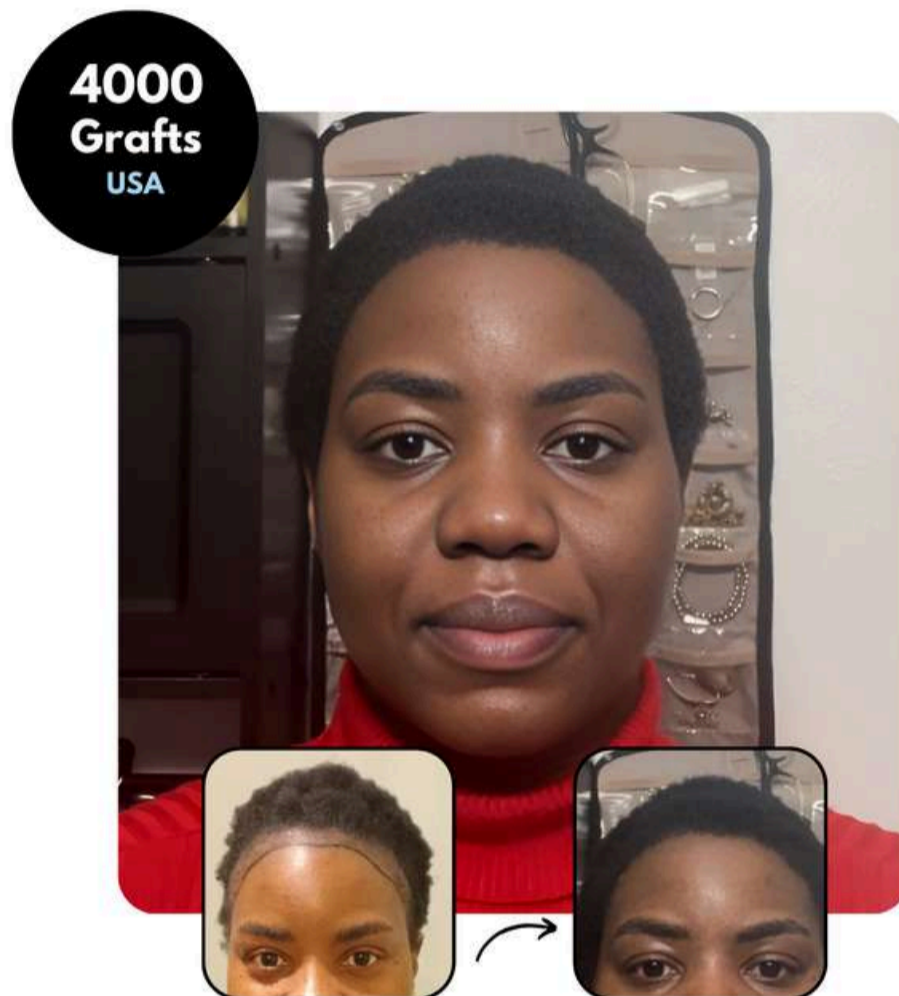

# IDEAL ICE DIRECT HAIR IMPLANT

Ideal ICE Direct Hair Implant is an advanced next generation method that gives amazing results due to its precision and natural-looking result, particularly in low density areas on top and in hairline. The procedure involves the extraction of individual hair follicles from the safe donor area, typically the back of scalp, where hair is genetically resistant to balding. These follicles are then meticulously implanted directly into the recipient area, which is the balding or thinning area of the scalp, without the need for creating incisions or channels beforehand.

The key instrument used in Ideal ICE Direct Hair Implants is the Ideal Implanter, a specialized tool that allows for the extraction and implantation of hair follicles in one seamless process. The Ideal Implanter has a hollow needle with a diameter slightly smaller than the hair follicle, which minimizes trauma to the surrounding tissue during extraction and implantation. This ensures a more comfortable experience for the patient and promotes faster healing.

The Ideal ICE Direct Hair Implant procedure typically begins with the extraction of hair follicles from the donor area using the Ideal Implanter. The follicles are carefully selected to match the natural hair growth pattern and density of the recipient area.

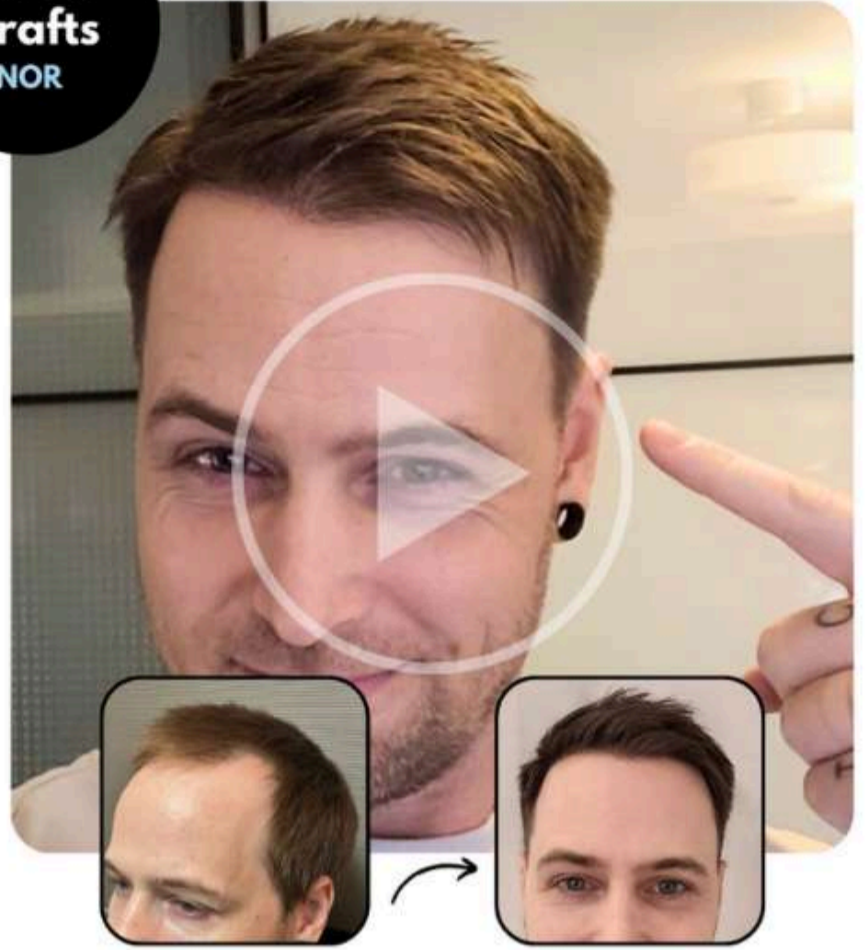

**Latasha, pictured above, flew to us from the USA, and opted for DHI, which was in this case specifically adapted for the needs of Afro hair. Her procedure involved 4000 grafts.**

One of the main advantages of Ideal ICE Direct Hair Implant is its ability to achieve a high level of precision and density, resulting in a more natural-looking hair and overall appearance. Additionally, because the follicles are implanted directly into the recipient area, typically, without the need for creating incisions or channels, there is minimal trauma to the scalp and faster healing times compared to traditional hair transplant methods.

**3600 Grafts**  
NOR

CLICK ON THE PICTURE TO WATCH KENT'S TESTIMONIAL

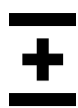

After the Ideal ICE Direct Hair Implant procedure, patients can expect some mild swelling and discomfort in the donor and recipient areas, which typically subsides within a few days. The transplanted hair follicles may shed within the first few weeks, but new hair growth begin to emerge within a few months. Over time, the transplanted hair will continue to grow and blend seamlessly with the existing hair, providing long-lasting and natural-looking results.

**4700 Grafts**  
USA

Overall, the Ideal ICE Direct Hair Implant procedure offers a safe, effective, and minimally invasive solution for individuals seeking to restore their low density areas and their hairline to improve their appearance.

# ADVANTAGES OF THE IDEAL ICE DIRECT HAIR IMPLANT METHOD

## NO SCALPEL INCISIONS

Traditional hair transplant methods, like Follicular Unit Transplantation (FUT) and Follicular Unit Extraction (FUE), involve making incisions with scalpels. In contrast, the Ideal ICE Direct Hair Implant method uses a specialized tool called an Ideal Planter, which has a hollow needle that directly implants hair follicles without any scalpel incisions.

## NATURAL RESULTS

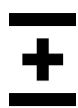

With Ideal ICE Direct Hair Implant, each hair follicle is individually implanted using the Ideal Planter. This precise technique allows the surgeon to control the angle, depth, and direction of each follicle, ensuring natural growth patterns. As a result, Ideal ICE Direct Hair Implant often produces more natural-looking results, with transplanted hair blending seamlessly with existing hair.

## FASTER RECOVERY

Since Ideal ICE Direct Hair Implant doesn't involve removing a strip of tissue or creating scalpel incisions, the procedure is less invasive. Patients typically experience less post-operative discomfort and swelling, leading to a faster recovery. Most can resume normal activities within a few days.

## HIGH GRAFT SURVIVAL RATE

The Ideal Planter used in Ideal ICE Direct Hair Implant allows precise placement of hair follicles at the correct depth and angle, minimizing trauma and resulting in a higher graft survival rate. This leads to better overall growth and density compared to other methods. Ideal ICE Direct Hair Implantation offers several advantages over traditional hair transplants, including more natural-looking results, faster recovery times, and higher graft survival rates, especially in the frontal and mid-scalp areas.

# IDEAL COMBINATION SURGERY

4500  
Grafts  
CAN

Our trademark Ideal ICE Direct Hair Implant combined with Ideal ICE FUE Sapphire procedure. At IdealofMeD, we've pioneered a revolutionary approach known as the Ideal Combination Surgery, a meticulously orchestrated fusion of the two next generation advanced techniques designed to comprehensively address the complexities of hair restoration.

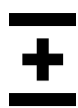

This cutting-edge procedure seamlessly integrates the precision of the Ideal ICE FUE Sapphire method, the finesse of the Ideal ICE Direct Hair Implant method, and the enhanced survival rates provided by Ideal ICE technology. Beginning with meticulous planning, our team leverages state-of-the-art imaging technology to map out the intricacies of each patient's unique hairline and follicular distribution.

The Ideal Combination Surgery represents the pinnacle of modern hair restoration, offering patients unparalleled precision, safety, and efficacy in their journey towards natural-looking hair restoration. The Ideal Combination Surgery is predominantly indicated for patients presenting with a combination of lower hair density in the frontal area alongside patches of alopecia in the crown area. In such instances, the Ideal ICE Direct Hair Implant is commonly employed for anterior reconstruction to achieve a natural and robust hairline, while the reliable Ideal ICE FUE Sapphire method is chosen for populating the deficient crown regions.

**+** MIXED METHOD RESULTS

Wanderley, pictured on the right, is originally from Brazil, and joined us in Istanbul for his combination hair transplant. His surgery involved 2250 grafts transplanted with the Ideal ICE FUE Sapphire method, and another 900 with the Ideal ICE Direct Hair Implant method. The pictured progress was taken a mere 6 months following the operation.

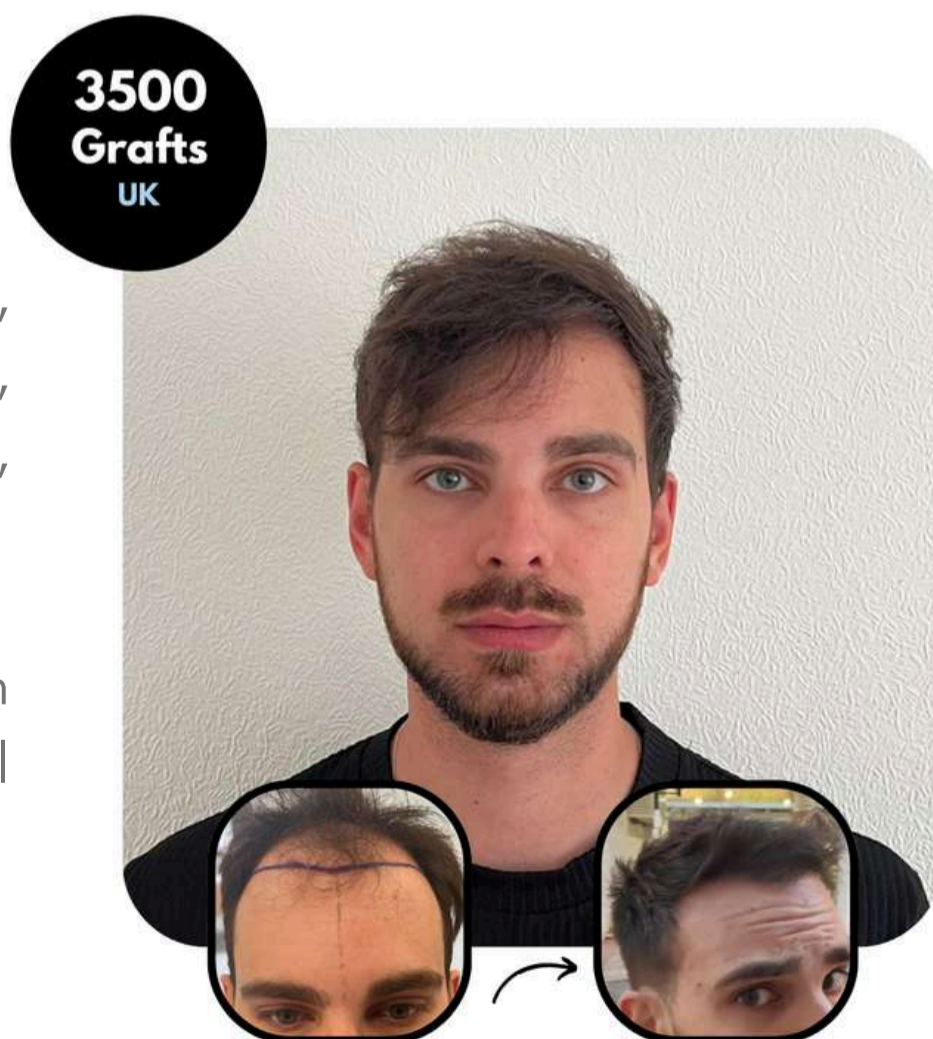

Similarly, Niel, from South Africa, had a hair transplant with the Ideal Combination Surgery, using an overall of 3250 grafts.

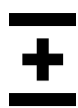

6 months post-surgery, Niel looks amazing and his receding hairline has been completely fixed.

Eduardo, aged 30, from the UK, had 3500 grafts transplanted, and fixed his receding hairline, just like Niel.

The picture he sent us was taken one year after his Ideal Combination Surgery.

## MIXED METHOD RESULTS

**4700

**3150  
Grafts  
ITALY**

Meet Wanderley from Italy, 33 years old, who underwent an Ideal Combination Surgery with us. Wanderley's procedure involved 3150 grafts, and after 9 months, his progress is truly impressive, having completely fixed his balding crown and frontal areas.

# IDEAL ICE TECHNOLOGY

IDEAL ICE TECHNOLOGY

All our next generation hair transplant methods feature the specialized integration of Ideal ICE Technology: **Intra-Operative Cooling of Extracted Grafts**. This advanced technique underscores precision, involving the meticulous cooling of hair follicles during extraction, utilizing tailored instruments and containers designed for optimal performance.

By immersing grafts in a controlled environment with precise temperature regulation, **Ideal ICE Technology enhances graft viability and survival rates** significantly. This method reduces cellular stress and enhances transplant success, particularly in delicate areas like the hairline and crown. Through the strategic application of Ideal ICE Technology alongside advanced surgical methodologies, we ensure maximum graft survival and minimize scalp trauma, achieving natural-looking results.

It's crucial to emphasize that while many in the field continue to rely on manual cooling methods, these approaches are often less effective and precise than Ideal ICE Technology. Our commitment to medical excellence drives us to utilize the most advanced techniques available, ensuring that each patient receives the **highest standard of care** in hair transplantation.

Our unwavering dedication to excellence in modern hair restoration techniques is evidenced by our significant investment in Ideal ICE Technology. This commitment elevates the quality of care we provide to our patients, setting a new standard for the field of hair transplantation.

## Saw Palmetto: Hair Rejuvenation & Wellness

In the quest for vibrant hair and overall well-being, nature has often offered hidden treasures that hold the promise of transformative effects. One such gem is Saw Palmetto (*Serenoa repens*), a plant native to the southeastern United States and a key ingredient in our Hair Rejuvenation Vitamins.

Ancient herbology, rooted in traditional practices like those of Native American tribes, such as the Seminole, Creek, and Miccosukee recognized the therapeutic potential of Saw Palmetto for various health concerns. The berries were often consumed to alleviate urinary and reproductive issues, such as urinary tract infections and prostate problems.

The berries were believed to possess diuretic and tonic properties and Native American healers also recognized the plant's potential benefits for supporting overall well-being.

Saw Palmetto's rich history, rooted in Native American traditions, has paved the way for its exploration as a potential remedy for a wide range of health conditions. Its mechanisms of action, notably its interaction with hormones and anti-inflammatory properties, hold promise for addressing various concerns in both men and women.
